

Gendrive Totus Inverters

Gendrive supplied Totus inverters/converters for various wind turbine manufacturers. Totus inverters includes integral vector shift protection. Although this cannot be explicitly turned off, it can be set to 300° which means that it will never operate.

The Programme accepts that a setting of 300° is an appropriate and compliant setting for these converters and, post the change of setting, should be entered on the portal as “made inoperative”.

The Programme believes that these converters are all set up by the parameters being programmed in a plain text file, and that the vector shift setting is contained in a block of parameters labelled “G59/2 Parameters.”
