

# Form C: Type Test Verification Report

Type Approval and Manufacturer declaration of compliance with the requirements of G98.

This form should be used when making a Type Test submission to the Energy Networks Association (ENA).

If the **Micro-generator** is **Fully Type Tested** and already registered with the ENA **Type Test Verification Report** Register, the **Installation Document** should include the **Manufacturer**'s Reference Number (the Product ID), and this form does not need to be submitted.

Where the **Micro-generator** is not registered with the ENA **Type Test Verification Report** Register this form needs to be completed and provided to the **DNO**, to confirm that the **Micro-generator** has been tested to satisfy the requirements of this EREC G98.

Note that testing can be done by the **Manufacturer** of an individual component or by an external test house.

Where parts of the testing are carried out by persons or organisations other than the **Manufacturer** then that person or organisation shall keep copies of all test records and results supplied to them to verify that the testing has been carried out by people with sufficient technical competency to carry out the tests.

**1.Operating Range:** This test should be carried out as specified in A.1.2.10.

**Active Power** shall be recorded every second. The tests will verify that the **Micro-generator** can operate within the required ranges for the specified period of time.

The Interface Protection shall be disabled during the tests.

In case of a PV Micro-generator the PV primary source may be replaced by a DC source.

In case of a full converter **Micro-generator** (eg wind) the primary source and the prime mover **Inverter**/rectifier may be replaced by a **DC** source.

In case of a DFIG **Micro-generator** the mechanical drive system may be replaced by a test bench motor.

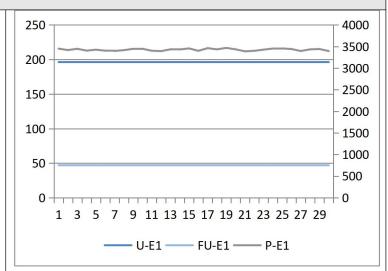

Test 1

Voltage = 85% of nominal (195.5 V),

Frequency = 47 Hz,

Power Factor = 1,

Period of test 20 s

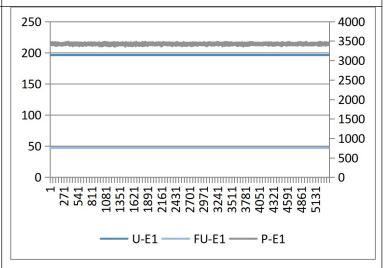

Test 2

Voltage = 85% of nominal (195.5 V)

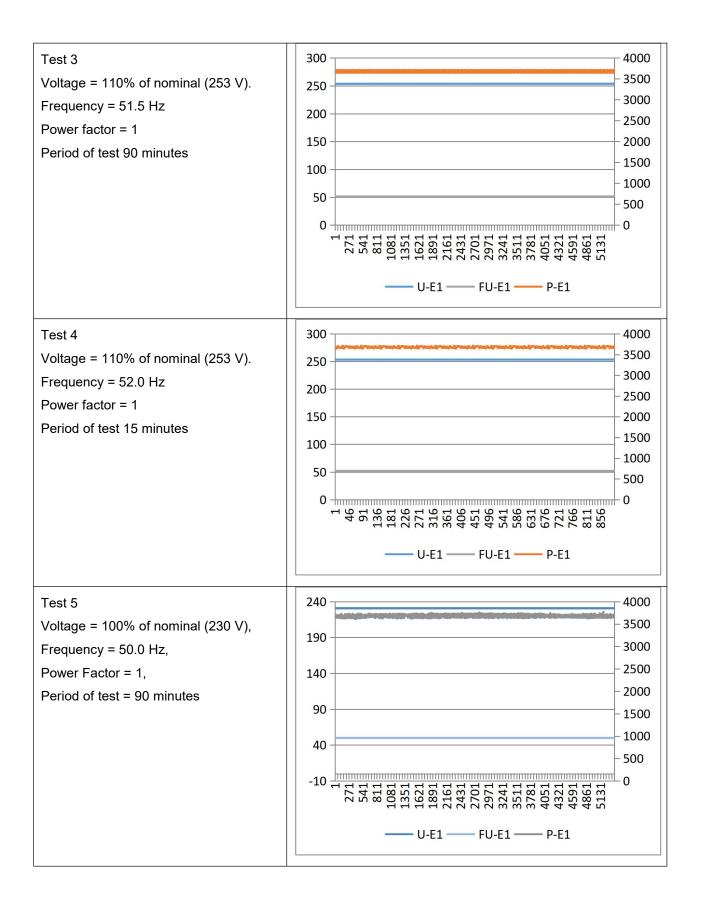

Frequency = 47.5 Hz

Power factor = 1

Period of test 90 minutes

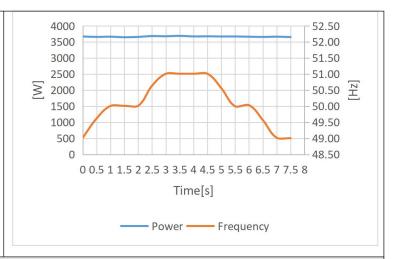

#### Test 6 RoCoF withstand

Confirm that the Power Generating Module is capable of staying connected to the Distribution Network and operate at rates of change of frequency up to 1 Hzs-1 as measured over a period of 500 ms. Note that this is not expected to be demonstrated on site.

**2.Power Quality – Harmonics:** These tests should be carried out as specified in BS EN 61000-3-2. The chosen test should be undertaken with a fixed source of energy at two power levels a) between 45 and 55% and b) at 100% of Registered Capacity. The test requirements are specified in Annex A1 A.1.3.1 (Inverter connected) or Annex A2 A.2.3.1 (Synchronous).

# **3.Power Quality – Voltage fluctuations and Flicker**: These tests should be undertaken in accordance with EREC G98 Annex A1 A.1.3.3 (Inverter connected) or Annex A2 A.2.3.3 (Synchronous).

Applies to three phase and split single phase Micro-generators.

<sup>^</sup> Applies to single phase Micro-generators and Micro-generators using two phases on a three phase

### system.

For voltage change and flicker measurements the following formula is to be used to convert the measured values to the normalised values where the power factor of the generation output is 0.98 or above.

Normalised value = Measured value\*reference source resistance/measured source resistance at test point.

Single phase units reference source resistance is 0.4  $\Omega$ 

Two phase units in a three phase system reference source resistance is  $0.4 \Omega$ .

Two phase units in a split phase system reference source resistance is  $0.24~\Omega$ .

Three phase units reference source resistance is  $0.24~\Omega$ .

Where the power factor of the output is under 0.98 then the X to R ratio of the test impedance should be close to that of the Standard Impedance.

The stopping test should be a trip from full load operation.

The duration of these tests need to conform to the particular requirements set out in the testing notes for the technology under test. Dates and location of the test need to be noted below.

Test start date	19,Jun,2022	Test end date	19,Jun,2022

where the base current is the Registered Capacity (W)  $\!\!/$  230 V. The  $\!\!%$  DC injection should not be greater

than 0.25%.

Test power level(3.6k)	20%	50%	75%	100%

**5.Power Quality – Power factor**: This test shall be carried out in accordance with EN 50548 Annex D.3.4.1 but with nominal voltage -6% and +10%. Voltage to be maintained within  $\pm 1.5\%$  of the stated level during the test.

**6.Protection – Frequency tests:** These tests should be carried out in accordance with EN 50438 Annex D.2.4 and the notes in EREC G98 Annex A1 A.1.2.3 (**Inverter** connected) or Annex A2 A.2.2.3 (Synchronous)

Function	Setting		Trip test		"No trip tests"

					46.8 Hz 0.45 s	No trip
O/F stage	52 Hz	0.5 s	52.01Hz	0.508s	51.8 Hz 120.0 s	No trip

Note. For frequency trip tests the frequency required to trip is the setting  $\pm$  0.1 Hz. In order to measure the time delay a larger deviation than the minimum required to operate the projection can be used. The "No trip tests" need to be carried out at the setting  $\pm$  0.2 Hz and for the relevant times as shown in the table above to ensure that the protection will not trip in error.

**7.Protection – Voltage tests:** These tests should be carried out in accordance with EN 50438 Annex D.2.3 and the notes in EREC G98 Annex A1 A.1.2.2 (**Inverter** connected) or Annex A2 A.2.2.2 (Synchronous)

Function	Setting		Trip test		"No trip tests"

Note for Voltage tests the Voltage required to trip is the setting  $\pm 3.45$  V. The time delay can be measured at a larger deviation than the minimum required to operate the protection. The No trip tests need to be carried out at the setting  $\pm 4$  V and for the relevant times as shown in the table above to ensure that the protection will not trip in error.

**8.Protection – Loss of Mains test:** For PV Inverters shall be tested in accordance with BS EN 62116. Other Inverters should be tested in accordance with EN 50438 Annex D.2.5 at 10%, 55% and 100% of rated power.

To be carried out at three output power levels with a tolerance of plus or minus 5% in Test Power levels.

#### 13.Re-connection timer.

Test should prove that the reconnection sequence starts after a minimum delay of 20 s for restoration of voltage and frequency to within the stage 1 settings of Table 2. Both the time delay setting and the measured delay should be provided in this form; both should be greater than 20 s to pass. Confirmation should be provided that the Micro-generating Plant does not reconnect at the voltage and frequency settings below; a statement of "no reconnection" can be made.

Time delay setting	Measured delay		Checks on no reconnection when voltage or frequency is brought to just outside stage 1 limits of table 2.					
20	30S		At 266.2 V	At 266.2 V At 180.0 V At 47.4 Hz At 52.1 Hz				
Confirmation that the Microgenerator does not re-connect.			Yes	Yes	Yes	Yes		

**14.Fault level contribution**: These tests shall be carried out in accordance with EREC G98 Annex A1 A.1.3.5 (**Inverter** connected) and Annex A2 A.2.3.4 (Synchronous).

For machines with electro-magne	etic output	For <b>Inverter</b> output			
Parameter	Symbol	Value	Time after fault	Volts	Amps
Peak Short Circuit current	ĺρ	-	20 ms	81.2V	29.3A
Initial Value of aperiodic current	Α	-	100 ms	77.3V	22.1A

For rotating machines and linear piston machines the test should produce a 0 s - 2 s plot of the short circuit current as seen at the **Micro-generator** terminals.

<sup>\*</sup> Values for these parameters should be provided where the short circuit duration is sufficiently long to

enable interpolation of the plot						
15.Logic Interface.	Yes					
This equipment is equipped with RJ45 terminal for logic interface that being receive the signal from the DNO, the connection should be installed per installation manual, an the signal should be a simple binary output that captured by RJ45 terminal( PIN 5 and for detecting the signal). Once the signal actived, the inverter will reduce its active power to zero within 5s.						
<b>16.Self-Monitoring solid state switching:</b> No specified test requirements. Refer to EREC G98 Annex A1 A.1.3.6 ( <b>Inverter</b> connected).	Yes or NA					
It has been verified that in the event of the solid state switching device failing to disconnect the <b>Micro-generator</b> , the voltage on the output side of the switching device is reduced to a value below 50 V within 0.5 s.	NA					
17. Cyber security	Yes or NA					
Confirm that the Manufacturer or Installer of the Micro-generator has provided a statement describing how the Micro-generator has been designed to comply with cyber security requirements, as detailed in 9.7.	Yes
